

→ HTML, CSS, Jinja templates

```
@app.route ("/home")
```

```
def home():
```

```
    return render_template ("home.html")
```

→ in HTML file

```
<body> method="post"
```

```
<form action="/submit">
```

```
<input type="text">
```

```
<input type="text" name="username"
```

```
placeholder="Enter your username">
```

→ in app.py file

```
@app.route ("/submit", method=["POST"])
```

```
def login():
```

```
    username = request.form.get("username")
```

```
    password = request.form.get("password")
```

```
    if username == " " & password == " "
```

```
        return render_template ("welcome.html")
```

```
    valid_users =
```

```
        'admin' : '123',
```

```
        'Sagar' : '246',
```

```
        'Shivam' : '001'
```

```
}
```

```
    if username in valid_users and
```

```
        password == valid_users[username]:
```

```
        return render_template ("welcome.html")
```

```
    else: return "Invalid" name=username) SPS'
```

→ Jinja2 template is used to make HTML page dynamically where we can use python values, loops and condition inside HTML file

→ Syntax

1> python values

{{ Variables }}
{{ name }}

<p> Welcome {{ name }} </p>

2> Conditionals

{% else %}
{% if %} ... {% endif %}

In app.py

@app.route('/') :

```
def student_profile():  
    return render_template(  
        'profile.html',  
        name = 'Arun',  
        is_topper = True,  
        subjects = ['Maths', 'Science',  
                    'History']  
    )
```

In profile.html
<body>

```
<h1> Hello {{ name }} </h1>  
{% if is_topper %}  
<p> good </p>  
{% else %}  
<p> bad </p>  
{% endif %}
```

//_

```

<h3> your subjects </h3>
<ul>
{ % for subject in subjects %}
  <li> Maths </li>
<li> {{subject}} </li> <li> science </li> } X
  <li> history </li>
{ % end for %}

```

→ Template Inheritance

- it is used to define a base layout in Django template
- we define a base.html file that we can use in every html file
- eg: header file, footer file

→ base.html

```
{% block Content %}      {% enable %}
```

→ how to use base file in child file

```
{% extends 'base.html' %}
```
