

→ Flask fundamental

→ prerequisite

i> python

ii> HTML

```
from flask import Flask
```

```
app = Flask(__name__)
```

→ we made a object that represent our website.

↗ flask object
@app.route("/") → home page

decorator
def home(): → this fn connected to home page
return "Hello user!"

→ This message print in our home page website.

```
@app.route("/about")
```

```
def about():
```

```
return "this is our about page"
```

→ always make route unique

→ always readable route name

→ all route return something

→ HTTP Method

→ GET Method : it is used to see the (get data) information only.
Maps a specific url route to a python fn to safely retrieve data from webserver

→ POST Method : an HTTP request (send data) type used to submit data to a server for processing, creating or updating a resource

→ Syntax :- import request

```
@app.route("/submit", methods = ["GET", "POST"])
```

```
def submit():  
    if request.method == "POST":  
        return "you sent data"  
    else:  
        return "you got retrieve data"
```

• if want to access method then we have to import request

→ fi

→ final summary Table

Core object	What it does	Easy Example
request	Read what the user sends	request for ['name'] for a form
response	send something back to the browser	return Response(...., MIME.type =)
redirect	Move the user to different page	redirect("/thankyou")
Url_for	build a route dynamically for name	url_for("home") → "/home"
Session	Remember user info across pages	session["username"] = "shivam"

→ Login page → project 1 using Flask

Login page
 accept username & password
 session store
 redirect welcome page
 logout

Project flow ↓

Code:

```
from flask import Flask, request, redirect, url_for, session, Response
```

```
app = Flask(__name__)
```

```
# homepage login page
```

```
@app.route("/", methods = ["GET", "POST"])
```

```
def login():
```

```
    if request.method == "POST":
```
